PROCESSES AND PROPERTIES INDEX

Nitrogen assimilation and symbiotic system of *Calotermes flavicollis*. László Tóth (Magyar Biol. Kutatóintézet, Tihany, Hungary). *Magyar Biol. Kutatóintézet Munkái* 16, 7-35(1944-45). - Calotermite can live exclusively on carbohydrate foods. Microorganisms existing in their intestines make cellulose assimilation possible. Their requirement of carbohydrates and fats (including that of their symbionts) is fully covered by food taken up orally. Expts. showed that they can assimilate atmospheric nitrogen in a manner hitherto unexplained. The symbionts living in the intestines build up simple nitrogen compounds to valuable proteins available for the termites.

"Acute Anuria Cases of Various Origins"

Budapest, Orvosi Hetilap, Vol 104, No 20, 19 May 1963, pp. 918-920.

Abstract: Two hundred cases of acute anuria were treated at the authors' clinic since Feb 1960; 148 patients of these were handled in the artificial kidney department. Cases caused by operative shock had a high mortality rate (11 out of 14); so did the cases caused by accidents. The cure rate of cases originating from complications following transfusion, sepsis, poisoning, was high. All patients suffering from anuria caused by eclampsia following pregnancy died since dialysis treatments were ineffective. Twenty three references, including 7 German, 5 Hungarian, and 11 Western.

"The Hepatorenal Syndrome."

Budapest, Orvosi Hetilap, Vol 107, No 41, 9 Oct 66, pages 1926-1928.

Abstract: [Authors' Hungarian summary] 1) Justifications for the "hepatorenal syndrome" designation are examined using the data of the oligo-anuric patient material of the hemodialysis section of the Urological Clinic. 2) It was found that liver lesion or jaundice is often found simultaneously with oligo-anuria. The relationship between the two processes could be elucidated in every case; such correlations which would have confirmed the presence of a special liver toxin as the cause of the renal damage could not be demonstrated, however. 3) The hepatorenal-syndrome designation is thought to be incorrect and the use of the term unjustified. 2 Hungarian, 6 Western references.

TITLE: Virological investigation of hospitalized cases of pseudocroup and acute laryngotracheobronchitis

SOURCE: Academia scientiarum hungaricae. Acta microbiologia, v. 12, no. 2, 1965, 189-200

TOPIC TAGS: virology, serum, antibody, virus, immunology, epidemiology

ABSTRACT: Infants and young children, admitted during a 12 months period with the pseudocroup-acute laryngotracheobronchitis syndrome, have been tested for respiratory viruses. Virus isolation was attempted in 423 cases, antibody response was determined in 229 serum pairs. Isolated were 261 virus strains in the following percentage distribution: parainfluenza type 3, 34.1%; RS virus 23.0%; adenovirus 17.6%; parainfluenza type 1, 1.1%. It was possible to base an etiological diagnosis on both virus isolation and serological test in 128 cases, on virus isolation alone in 133 cases, and on serological test alone in 58 cases. The immunological reaction among parainfluenza types, the double immune responses, the problem of recurrent pseudocroup, as well as the etiology of complicated cases are discussed. The authors thank Doctor E. Farkas and Doctor I. Domok (State Institute of Hygiene, Budapest) for laboratory facilities and advice during the study, as well as type strains, antigens and hyper-immune sera. They also thank Miss E. Budai and Miss E. Schlitter for excellent technical assistance. Orig. art. has: 1 figure and 4 tables. [JPRS: 33,500]

"Relationship Between Age and Incidence of Hemagglutination-Inhibiting Antibodies Against Reovirus Types 1, 2 and 3."

Budapest, Acta Microbiologica Academiae Scientiarum Hungaricae, Vol XIII, No 2, 1966, pages 119-126.

Abstract: [English article, authors' English summary modified] The hemagglutination-inhibiting (HI) antibodies against the three reovirus types were titrated in serum samples collected from 1982, mostly healthy persons living in Hungary. Antibodies to types 1, 2 and 3 were found in 73, 74 and 81 per cent of the samples, respectively. The percentage of seropositive sera appears to grow until the fourth decade of life in the case of types 1 and 2; in the case of type 3, the highest levels are reached between 3 and 5 years of age. The serological response of 273 hospitalized cases with acute respiratory infection was compared with that of 114 cases of viral hepatitis. No appreciable difference could be demonstrated. In 22 cases under 10 years of age which were clinically diagnosed as "viral infection", the incidence of antibody response to reovirus types 1 and 3 was relatively high (3 and 5, respectively). The HI test was found to be of equal value to the neutralization test in detecting reovirus antibodies. A close correlation exists between HI and neutralization titers. 3 Eastern European, 37 Western references. 1/1 [Manuscript received 4 Nov 65.]

"A Test for the Cytochrome Oxidase System Based on the 'Nadi' Reaction by Means of a Filter Paper Micromethod."

Budapest, Kiserletes Orvostudomány, Vol XV, No 3, June 1963, pp 329-332.

Abstract: [Authors' German summary] A dry filter paper method was developed for the determination of the cytochrome C-cytochrome oxidase system. The method is based on the "Nadi" reaction. The filter paper is soaked in an alcoholic solution of α -naphthol and diethyl-p-phenylene diamine. After drying, a sample of the 24-hour culture of the bacterium, grown on simple agar, is applied on the paper. A blue color indicates positive results. 1728 different strains of bacteria have been examined for the presence of the cytochrome C-cytochrome oxidase system by this method. The method is suited for testing of large series of bacteria, its sensitivity is greater than that of other methods described in the literature. 2 Hungarian, 9 Western references.

TITLE: Investigation of the relations associated with the energetic parameters of aluminum-melt electrolysis. (part 1)

SOURCE: Kohaszati lapok, no. 2, 1966, 79-90

TOPIC TAGS: aluminum metallurgy, metal extracting, electrolytic refining

ABSTRACT: The following factors were investigated with the aim of establishing data on which to base calculations for determining the effects of the various parameters on the electrolysis of aluminum melts in a numerical manner: anode requirements of the chemical reactions and of the carbonaceous slag, quantity and composition of the anode gases, relations between current efficiency, gas composition, and anode consumption; carbon-energy balance, utilization of carbon-energy, electrical energy balance, thermal balance, and anode composition. The data obtained were presented and discussed. orig. art. has: 10 figures, 49 formulas and 3 tables.

"Acute Kidney Insufficiency Caused by Mercury Compounds"

Budapest, Orvosi Hetilap, Vol 107, No 24, 12 Jun 1966, pp 1118-1120.

Abstract: In order to demonstrate the effect of mercury compounds on the development of kidney insufficiency in an acute manner, the authors describe their experiences in this field. This involves 14 cases at the Artificial-Kidney Department (Művese Osztály) of the Urological Clinic. These cases were discussed and the respective clinical and pathological factors were described. The prognosis of acute kidney insufficiency caused by mercury compounds appears to be brighter today than has been before. 16 references, including 10 Hungarian, 1 German, and 5 Western.
